                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIMILARITY: Belongs to the NOTCH family.
SIMILARITY: Contains 36 EGP-like domains
SIMILARITY: Contains 3 Lin/Notch repeats
SIMILARITY: Contains 6 ANK repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FUNCTION: Signaling protein, which regulates, with both positive and negative signals, the differentiation of at least central and peripheral nervous system and eye, wing disk, oogenesis, segmental appendages such as antennae and legs, and muscles, through lateral inhibition or induction. Functions as a receptor for membrane-bound ligands Delta and Serrate to regulate cell-fate determination. Upon ligand activation, and releasing from the cell membrane, the Notch intracellular domain (NICD) forms a transcriptional activates genes of the E(spl) complex. Essential for proper differentiation of ectoderm.

SUBUNIT: Interacts with Su(H) when activated. Interacts with Dx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              via its ANK repeats.

SUBCELLULAR LOCATION: Type I membrane protein. Upon activation SICEALULAR LOCATION: Type I membrane protein. Upon activation SI cleavage, it is released from the cell membrane and enters the nucleus in conjunction with Su(H).

PTM: Upon binding its ligands such as Delta or Serrate, it is cleaved (S2 cleavage) in its such as Delta domain, close to the transmembrane domain. S2 cleavage is probably mediated by Kuz is then cleaved (S3 cleavage) downstream of its transmembrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             domain, releasing it from the cell membrane.

                                                                FUNCTION: Catalyzes the covalent attachment of ubiquitin to othe proteins so as to signal them for selective protein degradation. Involved in the formation of multiubiquitin chains.

CATALYTIC ACTIVITY: ATP + ubiquitin + protein lysine = AMP + diphosphate + protein N-ubiquityllysine.

PATHWAY: Ubiquitin conjugation; second step.

MISCELLANGEOUS: A cysteine residue is required for ubiquitin-thiolester formation (By similarity).

SIMILARITY: Belongs to the ubiquitin-conjugating enzyme family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -I- FUNCTION: Catalyzes the covalent attachment of ubiquitin to other proteins so as to signal them for selective protein degradation. Involved in the formation of multiubiquitin chains.
-I- CATALYTIC ACTIVITY: ATP + ubiquitin + protein lysine = AMP +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE=22954850; PubMed=14593172;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diphosphate + protein N-ubiquityllysine.

PATHWAY: Ubiquitin conjugation; second step.

MISCELLANGUUS: A cysteine residue is required for ubiquitin-
thiolester formation (By similarity).

SIMILARITY: Belongs to the ubiquitin-conjugating enzyme family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           s SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (phosphohydroxy)-L-threonine (HTP) into 2-amino-3-oxo-4-(phosphohydroxy) butyric acid which spontaneously decarboxy form 1-amino-3-(phosphohydroxy) propan-2-one (3-amino-2-oxo) phosphate) (By similarity).

CATALYTIC ACTIVITY: 4-(phosphonooxy)-threonine + NAD(+) = amino-3-oxo-4-phosphonooxybutyrate + NADH.

PATHWAY: De novo synthesis of pyridoxine (vitamin B6) and pyridoxal phosphate.

SIMILARITY: Belongs to the pdxA family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: Catalyzes the NAD-dependent oxidation of 4-(phosphohydroxy)-L-threonine (HTP) into 2-amino-3-oxo-4-

(phosphohydroxy)-L-threonine (HTP) into 2-amino-3-oxo-4-
(phosphohydroxy) butyric acid which spontaneously decarboxylate
form 1-amino-3-(phosphohydroxy) propan-2-one (3-amino-2-oxopropy
phosphate) (By similarity).

CATALYTIC ACTIVITY: 4-(phosphonooxy)-threonine + NAD(+) = 2-
amino-3-oxo-4-phosphonooxybutyrate + NADH.

PATHWAY: De novo synthesis of pyridoxine (vitamin B6) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIMILARITY: Belongs to the pdxA family.

"The structure and function of mouse thrombomodulin. Phorbol myristate acetate stimulates degradation and synthesis of thrombomodulin without affecting mRNA levels in hemangioma cell thrombomodulin without affecting mRNA levels in hemangioma cell J. Biol. Chem. 263:15815-15822(1988).

-i- FUNCTION: Thrombomodulin is a specific endothelial cell rethat forms a 1:1 stoichiometric complex with thrombin. This complex is responsible for the conversion of protein Ca activated protein C (protein Ca). Once evolved, protein Ca scissions the activated cofactors of the coagulation mecha

Haematol. 118:595-599(2002).

FUNCTION: Thrombomodulin is a specific endoth that forms a 1:1 stoichiometric complex with complex is responsible for the conversion of activated protein C (protein Ca). Once evolve scissions the activated cofactors of the coag factor Va and factor VIIIa, and thereby reductions of the coag factor value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            thrombin

COFACTOR: Requires calcium ions.

TISSUE SPECIFICITY: Epidermis and hair follicles.

SIMILARITY: Belongs to the protein arginine deiminase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: Catalyzes the
